

SECURITY STATEMENT

We have a secure computer system to protect your personal information. We will upgrade our security system from time to time in accordance with the advancement of encryption technologies.

Strong Encryption

All information collected from you and transmitted over the Internet will be encrypted using the 128-bit Secure Socket Layer ("SSL"). Although there is no complete guarantee for the security of information, this strong encryption will significantly reduce the possibility of unauthorised interception, reading or stealing of your information during any transaction between you and us.

Automatic Time Out

As a safety precaution, after 30 minutes of inactivity we will terminate your secured Internet insurance session for you. This is for the protection of your privacy and to prevent unauthorised use in case you accidentally leave the session logged on after you have finished your transactions.

Security Involves You

You play an equally important role in protecting your personal information to avoid being responsible for transactions conducted by Third Parties. To ensure that such a role is properly carried out, you are advised to exercise the following precautionary steps:

- To exercise caution when performing your online transactions and ensure your PC and mobile devices Operating System (OS), Browser and Firewall settings are up to date with the latest security patches.
- To clear your browser's cache and history after each log in session.
- Protect your PC with an anti-virus software and keep it updated. Regularly scan your PC for any malicious software or viruses.
